Asset Tokenization

Specialized in technology and legal advice
for converting real assets into digital assets
via Blockchain networks.

What is an Asset?

It is a tangible or intangible economic resource that can be used by the holder to produce economic value such as: vehicle, property, commodities, bonds, investment funds, debentures, economic rights of athletes, court orders, credit rights, participation quotas, etc..

What is ASSET TOKENIZATION?

It is the process of issuing digital assets that represent a real tradable asset. Whoever acquires the token will have a stake in the business or good that this token represents. These rules will be set out in a smart contract.

What is a Smart Contract?

It is in a Digital Contract where the characteristics of opportunity and interaction of the token with the business model it represents are registered. All through Blockchain technology.

What is the role of Smart Contract in tokenization process?

Establish legal rules for token transactions and how they generate effect or monetization for the business, for the organization and for the token holder.

What is Blockchain?

It is a technology of distributed (ledger), encrypted registry, which aims at decentralization as a security measure through a validation network that eliminates intermediaries, making this ledger 100% transparent and accessible, but unintelligible for those who do not have access to the conventions combined in the *smart contract*.

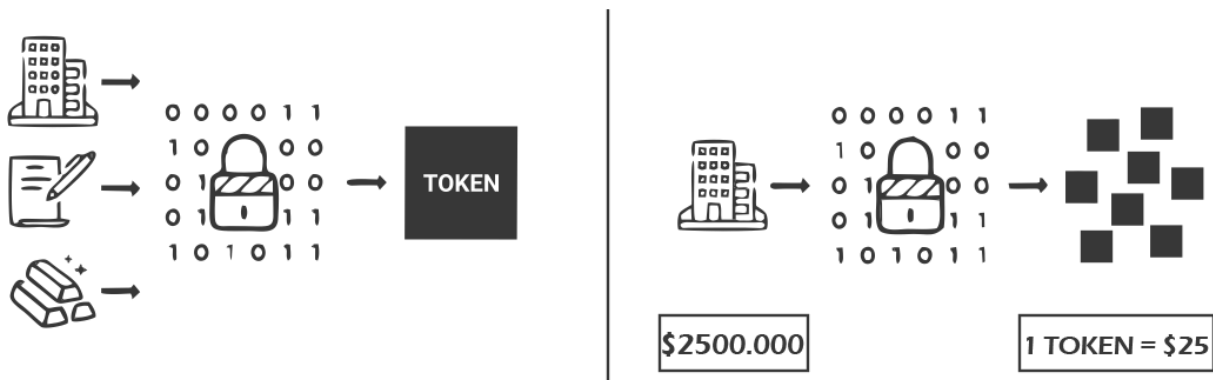

Advantages of Tokenization - How does it work?

When representing real assets through digital tokens in a blockchain, some of the advantages are:

- **Attracting new investors:** possibility of fractional ownership
- **Greater liquidity:** transaction facility promoted by tokenization
- **Speed and cost reduction:** the automation generated by tokenization through smart contract allows a great reduction of administrative costs, with 24/7 negotiation and without territorial barriers
